It would seem that there .Imaging methods for breast cancer detection: magnetic resonance and high-resolution ultrasound. Both magnetic resonance (MR) and high-resolution ultrasound (US) are established methods for the imaging of the female breast. They have specific advantages and disadvantages. While MRI is the method of choice for the detection of breast cancer and in the follow-up after local and systemic therapy, it is important to consider the additional advantage of US for the detection of microcalcifications. On the other hand, the sensitivity of MRI for the detection of small cancers or metastases is not as good as for US. The use of simultaneous tomosynthesis (TS) is a new tool that may improve the sensitivity of MR imaging. Additionally, high-resolution US is a method that can help to detect small cancers, especially in a dense breast. The aim of this paper is to provide a critical review of both MR and US for the detection of early and locally advanced breast cancer. An overview of the methods and techniques used in these methods is provided. } else if err := g.SaveAll(sc, context.Background(), opts); err!= nil { t.Errorf("Saving all list item failed: %v", err) } 2d92ce491b
