
Check out the process environment block details (PEB) for any process running on your system. AV: Plugin hijacking (signature: CLSID {356e7c48-b224-4e41-a59e-8cf1ce56c30d} PID 2636) by iAccess.Secunia.com detected. On November 21st, 2001, Microsoft released its first wave of Service Pack (SP) patches for Windows NT 4.0-based systems. The patches are available for NT 4.0, Windows 98, Windows 98 SE, Windows 2000, Windows NT 4.0 and Windows 2000 Terminal Server operating systems. The patches address 15 product bugs and the following four security issues: 1. Remote code execution vulnerability in the MMS service. 2. Remote code execution vulnerability in the paging software. 3. Remote code execution vulnerability in the Multilingual User Interface (MUI). 4. Multiple buffer overflow vulnerabilities in the subsystems of Windows. Microsoft's patches fix the problems, but some users do not install them because they fear they will not be able to easily upgrade to Windows 2000. They have a good point because the process of patching is more complicated in Windows 2000 than in previous versions. To help resolve this problem, Microsoft is rolling out a second batch of patches for Windows 2000, which corrects nine more bugs in the same four categories. The first of the fixes addresses two remote code execution bugs, two remote code execution bugs and a denial-of-service bug in the component services that run in the paging space and in the kernel space. The second of the patches corrects a denial-of-service bug in the MUI. The third patch fixes two buffer overflows in the subsystems of Windows, while the fourth patch addresses a bug in the font subsystem. The first Microsoft Windows 2000 Patch Tuesday began on November 21, 2001, and more updates will follow throughout the month of December. NOTE: This bulletin contains information that might be considered a security update. Microsoft Corporation has determined that this information constitutes a security update for Internet Explorer 7. This bulletin applies to the following editions of Internet Explorer 7: Windows 2000, 32-bit, Windows NT 4.0 Windows XP, 32-bit, Windows NT 4.0 Windows XP, 64-bit, Windows 2000 Windows XP, 32-bit, Windows NT 4.0 Windows XP, 64-bit, Windows 70238732e0

KEYMACRO is a highly professional application designed to perform a search, fetch and capture of file names and sub-files from your hard drive or your memory stick using only a single search key in order to retrieve any file or directory. This single search key can be typed directly or automatically generated from a list of your existing keywords. The application finds the path and file name of a file with a single key. This includes: - Files and Folders; - Subdirectories; - Full path to a file. KEYMACRO allows you to find where a file or folder is stored and quickly locate the exact path and file name of a particular file or directory. To start the search you need only type one or more keywords that will search for the file name or a specific part of the file name. KEYMACRO immediately displays the result in the program window, complete with file size and file type. KEYMACRO is a utility that performs a search on your hard drive and captures all files and directories matching the search, so that you can easily extract the most important information. KEYMACRO automatically exports and stores the file or directory path and file name, the file size, file type, and date and time that the file was last modified. When you first start KEYMACRO, it creates the list of your keywords from which a single key can be generated. KEYMACRO comes with a built-in list of over 500 commonly used keywords, which include files, folders, complete file path, dates, etc. In addition, there are over 130 additional keywords that can be added to the list of keywords. KEYMACRO also includes a file search feature that enables you to search for a specific file that you know the name of. Use the file search feature to search a single folder on your computer for a specific file. KEYMACRO will find the file and display the file name and path in the program window. The basic search feature lets you type the entire file or folder path. Alternatively, you can start typing a letter and the program will continue the search for you. When you run the program for the first time, it creates a list of your files and folders. Keywords are automatically generated from the keywords list and a single keyword can be automatically generated from a list of keywords. When you use the program for the first time, it generates the list of your keywords from the keywords list and it is saved to the program. If you want to search for files, folders or directories using
