Q: How to link a file from an external repository? I have a bunch of org files stored in a git repository on Bitbucket. I would like to add a link to one of these files. I tried org-agenda-files-update-link with a custom template, but that only works for org files that have been stored in the local repository. Is there a way to make that work for files from an external git repository?

A: I would use the updatedb.sh script that comes with your shell (such as bash, zsh, or csh),

because you need it to look in all the folders in the filesystem and generate a list of all the files, so that you can then just add the right link. The difference in infarct size among various groups is not explained by atrial conduction during reperfusion. Several experimental models have shown that the sudden release of the temporary ligation of the inferior vena cava (IVC) after 30 min of occlusion of the left circumflex coronary artery (LCX) results in a larger infarct size than that in a model with continuous LCX occlusion. We sought to investigate the possible explanation of this difference. We used the rabbit model of LCX occlusion combined with IVC ligation. In all experimental groups (group A, occlusion 30 min + ligation immediately after 30 min; group B, continuous occlusion for 30 min and ligation immediately after release of occlusion; group C, occlusion 30 min + ligation after 45 min of occlusion),

the IVC was simultaneously released at 2 different sites. At the end of the experiment, hematocrit, left ventricular end diastolic pressure, left ventricular end systolic pressure, left ventricular developed pressure, heart rate, and arterial blood gases were measured. The infarct size was determined by triphenyl tetrazolium chloride staining. There were 2d92ce491b
