The output of the height-adjustable suspension unit is detected using a switch that is actuated when the front wheel is raised relative to the body of the vehicle. The switch is activated when the corresponding driven wheel is lifted above a defined point in a characteristic curve which describes the travel of the front wheel in dependence on the height of the body of the vehicle. This height-adjustable suspension unit can be integrated in a controllable motor vehicle in the manner described in a patent application entitled "Height-Adjustable Suspension Unit With Proportional Transmission" by the assignee of the present invention which is hereby incorporated by reference. The higher the stored energy in the rear-wheel drive propulsion means, the better the steering characteristic in corners. A passive steering improvement is obtained when reducing the transfer resistance of the steering means from the drive wheels to the chassis of the vehicle, especially when the vehicle is placed in a zero-degree turn. The device with a height-adjustable suspension unit also has a steering improvement when turning into a curve. The desirable orientation of the vehicle in the curve is of decisive importance for traffic safety when driving in curves. When placing the front wheels of the vehicle in the desired orientation in curves that are too tight for the vehicle, the vehicle turns into the curve ahead of the desired trajectory. Reducing the transfer resistance of the steering unit in the zero-degree turn leads to a correct steered vehicle movement in the curve. Another advantageous effect of the invention is an increase in the safety of the motor vehicle, especially in accidents involving lateral collisions. By reducing the transfer resistance of the vehicle's control system from the steering wheels to the chassis of the vehicle, the resistance to lateral countermovement in curves is reduced. When driving into curves, this means that, with the same or a less dynamic curvature and a relatively lower resistance to lateral countermovement in the curve, the vehicle is more likely to move out of the curve without excessive additional dynamics
