The cognitive and psychological effects of ecstasy use are well described in the literature, but the neurophysiological changes involved remain poorly understood. The current study addresses the effect of ecstasy on attention. Participants performed an auditory oddball task while receiving either placebo or 3 mg/kg MDMA in a double blind cross-over

design. P3a and P3b waveforms were elicited by target and novel stimuli. There was a main effect of task on P3a latency and amplitude, with P3a latency being longer for targets than novel stimuli for the placebo condition. There were no changes to P3a elicited by MDMA. However, the increase in P3b amplitude elicited by the target stimuli by MDMA was found to be of a greater magnitude than the decrease in P3b amplitude elicited by the novel stimuli. The amplitude changes in the P3b component are consistent with the known effects of MDMA on attentional processes.Q: How do I create new folders using apps installed on Android? Is it possible to "create" new folders from apps installed on the phone? The reason I ask is that I have a folder hierarchy that I would like to maintain and create new folders for new apps installed

on the phone, rather than just moving each app's data to a new directory. A: Short answer: it's not possible, because the way that apps are installed on Android doesn't provide that kind of functionality. Long answer: Each app on your phone is installed on the SD card using an app-specific folder. When the app is installed, it's given an arbitrary name that's part of that folder, so the app-specific folder on your phone is just that: /sdcard/Android/data/com.foo.bar/files/ When the app is uninstalled, any app-specific data is removed, and a new folder is added for the next app to install, like this: /sdcard/Android/data/com.foo.bar/files f30f4ceada
