The present invention relates to a connector used to electrically connect an internal circuit board to a flexible flat cable, and to a connector assembled therewith, and to an electrical junction box including the connector. A conventional connector will be described with reference to FIGS. 6 and 7. FIG. 6 is a perspective view of the conventional connector, in which a flexible flat cable 3 is inserted from the front side of the connector shown in FIG. 6. The flexible flat cable 3 is inserted into a housing 1 through a guide hole 2. Reference numeral 5 denotes a wire 3 which is connected with the rear end of the flexible flat cable 3, reference numeral 6 denotes a wire 8 which is connected with the front end of the flexible flat cable 3, and reference numeral 7 denotes a cable assembly having an electrical junction box 8a and an external terminal 8b. The flexible flat cable 3, which is inserted into the housing 1, is connected with a circuit board (not shown) through the wire 3 and the cable assembly 7. The cable assembly 7 is inserted into a receiving groove 9 formed in the housing 1, and is held by a cover 10, which is fixedly mounted to the housing 1. The flexible flat cable 3 includes a plurality of wires, which are formed in a ribbon-like shape. A plurality of conductive protrusions 3a are formed at the both sides of the cable 3 in a zigzag shape. Each of the conductive protrusions 3a contacts the internal contact pads of a circuit board. The wire 3 is connected to the cover 10. The wire 3 extends from the connector to the outside through a through-hole formed in the cover 10. FIG. 7 is a perspective view of a connector for an extended flexible flat cable, in which the flexible flat cable 3 is inserted through a guide groove from the front side of the connector shown in

A key, also known as a secret key or a password, is an algorithm for encryption, a process of converting data (plain text) into an unintelligible form (cipher text). A key allows data to be encrypted or decrypted. For example: When you need to keep your credit card number private and prevent others from reading it, you encrypt the information with a key, then store the encryption key (secret key) somewhere safe. When you need to decrypt the encrypted card number, you must provide the same key you used to encrypt the data (secret key) to the card number. The same key is used for both encryption and decryption. In the case of a key stored on a credit card, the same key is used for both encryption and decryption. You can use the KEYMACRO plug-in for Adobe Acrobat 9 to create an AES-256 encryption key on the fly for use in Adobe PDF documents. KEYMACRO encrypts a string with a 128-bit or 256-bit AES-256 encryption key. The encryption key is automatically generated in the encrypted output stream and can be used later to decrypt the same data. KEYMACRO is backward compatible with the DES encryption key. Usage: How to encrypt and decrypt a string with KEYMACRO Usage: KeyMacroEncrypt(String value, String key) Creates a new AES-256 encryption key and a cipher stream containing the encrypted value. KeyMacroEncryptString(String value) Creates a new AES-256 encryption key and a cipher stream containing the encrypted value. Usage: KeyMacroDecrypt(String value, String key) Creates a new AES-256 decryption key and a cipher stream containing the decrypted value. KeyMacroDecryptString(String value) Creates a new AES-256 decryption key and a cipher stream containing the decrypted value. Usage: KeyMacroEncryptString(String value, String key) Creates a new AES-256 encryption key and a cipher stream containing the encrypted value. KeyMacroEncryptString(String value) Creates a new AES-256 encryption key and a cipher stream containing the encrypted value. Usage: KeyMacroDecryptString(String value, String key) Creates a new AES-256 decryption key and a cipher stream containing the decrypted value. KeyMac 77a5ca646e
