See header file for documentation. Uses: See header file for documentation. HISTORY: Version 0.5 - 3/19/09 (dev): Initial release. Version 0.6 - 6/21/09 (dev): Small changes to prevent software compile errors. Version 0.8 - 8/18/09 (dev): Added new option "Skip_internal" to avoid internal state flashing. Version 1.0 - 9/28/09 (dev): Improved/tested compile process and resolved internal state flashing problem. Version 1.0 - 9/28/09 (stable): Optimized for smaller system. Version 1.0 - 10/18/09 (dev): Replaced old keyword "passthrough" for "source_mask" Version 1.0 - 10/18/09 (dev): Added new keyword "set_pin" to set a pin to the desired value. Version 1.1 - 1/2/10 (dev): Added the ability to select new input/output external pin (instead of always using the "pin_number" parameter). Version 1.1 - 1/2/10 (dev): Added new method "set_pin_method" to set the input/output pin method: Direct method (Toggle), I/O port (no set), Multiplexer (XOR), Shift Register (Binary AND). Version 1.2 - 3/20/10 (dev): Added new option "externally_controlled" for preventing internal state flashing when enabled (slower execution speed). Version 1.3 - 4/8/10 (dev): Prevented internal state flashing when changing state after enabling using the "set_state" method. Version 1.4 - 8/20/10 (dev): Optimized for newer OS (WinXP and above). Version 1.5 - 9/8/10 (dev): Optimized for more smaller system. Version 1.6 - 11/1/10 (dev): Improved and optimized the optimization process. Version 1.7 - 10/24/10 (dev): Added the ability to have more outputs pins than inputs pins (if you have 4 inputs and 3 outputs, it will generate 5 outputs). Version 1.8 - 12/2/10 (dev): Fixed some "source_mask" errors while creating a new file. Version 1.8 - 12/2/10 (77a5ca646e

AND and OR gates are used to create a logic function from a list of inputs. For example, say you have an input A1, an input B1, and an input C1. You want to create a logic function that returns true (1) when all three of these inputs are true (1), false (0) otherwise. You can create a logic gate with three inputs using the AND, OR, NAND, NOR, and XOR logic gates. The AND gate receives two inputs A1 and B1 and returns 1 if either is true, 0 otherwise. The OR gate receives two inputs A1 and B1 and returns 1 if either is true, 0 otherwise. The NAND gate receives three inputs A1, B1, and C1 and returns 1 if all three inputs are false, 0 otherwise. The NOR gate receives three inputs A1, B1, and C1 and returns 1 if none of the inputs are true, 0 otherwise. The XOR gate receives two inputs A1 and B1 and returns 1 if the inputs are opposite each other, 0 otherwise. The XNOR gate receives two inputs A1 and B1 and returns 1 if the inputs are the same, 0 otherwise. For example, to create a logic function that returns true (1) when the input A1 and input B1 are true, and returns false (0) otherwise: You can create this logic function with the logic gates AND, OR, NAND, NOR, and XOR. The NAND gate is particularly useful for creating logic functions that check a condition against all possible combinations of inputs. For example, you could build a logic function that checks to see whether the input A1 is true or false, and then make an OR gate with an output A2 that is 1 if A1 is true and 0 if A1 is false. That is, if you create a logic function that returns true (1) when A1 is true, and returns false (0) when A1 is false, you can create another logic function that returns a 1 when A1 is true and an 0 when A1 is false. You can accomplish this using an AND gate that has an input A1 and an output A2 that is 1 when A1 is true, and 0 when A1 is false. This is done by using an OR gate with the input A1 and the output A2 from the AND gate. Once
