Q: PHP convert a local time string to UTC time I have a timestamp as "1327472765" and I would like to convert it to a UTC time. I would like to know what the best method of doing that. So what I am trying is to convert that timestamp to the UNIX epoch and then add the offset from GMT. Here is my code: A: You can get the timestamp to unix epoch in PHP with: \$unixTime = strtotime(\$time); This will return the unix time stamp. You could then just convert to GMT using the date function, e.g.: \$unixTime = strtotime(\$time); \$utc = date("U", \$unixTime); \$utc should then be in GMT. A: \$Time = date('U', 1327472765); This invention relates to the field of digital processing, and more particularly to a system and method for receiving signals from an equipment rack. In high speed communications links, it is desirable to load multiple components onto a single circuit board and place them in a single rack (sometimes called a blade). A rack is a component enclosure, which may be in the form of a rectangular box, and which often contains several circuit boards. The circuit boards are typically arranged in parallel within the enclosure. The enclosure may be configured as a shelf, which includes at least one connector that is adapted to plug into a port, also known as an interconnect port, a backplane or a backplane connector, on the circuit board. When interconnecting a rack with a circuit board, a high-speed connector, such as a Multi-Fiber Small Form-factor Pluggable (MFSFP) connector, is typically used. As the term is employed herein, a high-speed connector is a connector that is capable of transmitting data in the 5-25 Gbits/sec range. Such connectors generally utilize a first portion of

So I had to do a search to find more details, which was annoying. However, the best part is that this is also not a flash-only solution. It
