Arction Gauges is an add-on for the development of communication devices and industrial applications. The package includes three Visual Studio add-ons: Arction Gauges (Wpf version) Arction Gauges (Silverlight version) Arction Gauges Toolkit The components are designed to simplify the visualization of different data sets. Arction Gauges provides three versions of radial gauges. The dials can be easily adjusted to provide a unique look and feel for your applications. Each gauge consists of a scroll bar, numeric display and the dial. The dials are also used to show the current value of the parameter. Because all dials are configurable, they can easily be displayed in different ways. The three dials include: Wheel: A wheel dial. Bubble Chart: A dynamic radial gauge chart. Card: An analog gauge. The dials can be adjusted in size, color and font. The scale can also be altered, as can the axis, color and origin of each wheel. All three gauges can show the current value of the parameters, and numeric data can be

displayed on the dials as text. You can even customize each indicator to display the value of each parameter in the different ranges. Each gauge is fully configurable via the properties. You can also customize the colors of the dials, the background and indicators. Arction Gauges includes three types of gauges, each of which is accompanied by multiple samples. You will also find a number of sample projects and a couple of useful sample utilities included. Arction Gauges is a Microsoft Visual Studio add-on that enables you to use several configurable radial gauges in your applications. The package includes components for both WPF and Silverlight, and detailed deployment instructions are provided. If you want to get a good idea of how these gauges can help you and what their main features are, you can run the included demo applications. It is important to note that these requirements are different for WPF and Silverlight. However, Microsoft Visual Studio is required in both cases, as well as .NET Framework. If you are using Silverlight, you should also make sure a Silverlight-capable browser is available, and that the necessary plug-in is installed. Naturally, any developer attempting to implement these components is expected to have previous experience with Visual Studio, as well as some basic programming knowledge. The included documentation is more than adequate, however, so even users who are relatively new to the field should be able to get the hang of things quickly enough.
