for property destructuring in a loop I am
wondering about the formal semantics of
destructuring in a loop, like the one below. The
semantics for the "in" property is clear to me:
The list is iterated over and for each element the
property is destructured. Now, I don't know
whether the "let" keyword inside the loop is
executed in a strict or a function call way. { [,
index] in for (let {i,...rest} = {i,...arr}; i > 0; i--)
{ // access rest[index] and rest[index + 1] } } I

would assume that the "let" keyword is executed in a function call way. Otherwise, I do not understand the let-keyword, because I could just write something like that in an arrow function, or I could write `let ({i,...rest}) = {i,...arr}`. A: This is not a function call way, its a lexical binding way `let {i,...rest} = {i,...arr}`

Q: How to use Foreach in asp.net I am trying to execute a command like this: `foreach (string i in arr) { // some code
Page.Response.Write(i); }` I want to execute this

code for each object in arr. But I get error:
`System.Web.UI.ControlCollection` does not
contain a definition for `'Foreach'` Can anybody
explain to me what is wrong here? A: The
reason why you are getting this error is because
`Response` is a `HttpWebResponse` object. You
cannot write a string to a `HttpWebResponse`
object, you need `77a5ca646e`

IMPRESSIONS: A no-brainer style. Thank goodness I finally wore a shirt this fall. These are my first pair of simple striped t-shirts from Old Navy and it was a no-brainer to grab it out of the closet. So, with a weekend in-progress, I decided to play a little dress up and rock this top with denim and some loafers. The gray color really worked with the deep burgundy leggings I

was wearing. (I wore the shoes that I bought at Target on Friday when I was at the mall.)Q: What is the recommended way to create XML document in Scala? A colleague of mine wants to migrate his project to Scala. This project uses a lot of Java libraries that export to XML documents, so he asked me if there is a way to do the same using Scala. I looked at the examples of XML parsers such as XML.scala. I couldn't find any examples on how to create an XML document using this library. Am I missing something? Is there a recommended way of creating an XML document using Scala? A: If you like the XML.scala library you can try to use the library directly with the JAXB annotations. XML source: package xml; import javax.xml.bind.annotation.XmlAccessType; import javax.xml.bind.annotation.XmlAccessorType; import javax.xml.bind.annotation.XmlElement; import

```
javax.xml.bind.annotation.XmlRootElement;  
import javax.xml.bind.annotation.XmlValue;  
@XmlAccessorType(XmlAccessType.FIELD)  
@XmlRoot
