You can either learn Photoshop one step at a time or buy a book on the topic, like Photoshop CS For Dummies (\$23.00) by Carl Sassenrath. In Part 2 of this article, we will review Photoshop's basic tools. In earlier versions of Photoshop, the user was limited to flattening an image to a bitmap (no layers) and then using brushes and paint tools to change the appearance of the image. With the release of Photoshop CS, users now have the ability to use layers in conjunction with raster effects to bring text and other content into Photoshop. Layers are a great way to apply multiple effects to an image. For example, you can create a dark, shadowed blur and darken the background and then add text that is placed on top of the layers. The text can then be shaped and blended with other shapes that are placed on top of the text. To create an image with layers, select File > New from Layers. You now have the ability to build and style the image in either a traditional Photoshop image format or as layers. Layer Styles allow you to add various effects to the layers, such as making the text darker or adding a drop shadow. You may have to experiment with the settings to see what works best for your image. Layer styles are applied in either pixel-based or print-based fashion. To apply layer styles, select

Bridging the gap: the "Ecotourism" industry in Europe A new report, published at the end of last year in The International Journal of Sustainable Tourism, seeks to provide an academic foundation for the debate, referring to such issues as the "ecological, economic and ethical challenges of ecotourism", and looking at the specificities of these three areas in the case of this industry. Based on a wide review of the literature, the authors have defined the scope of the research: "Ecotourism" is the actual tourism development strategy aimed at the promotion of protected areas and of natural tourism in order to enhance the feeling of visitors' immersion into nature. The national ecosystems are conceived not only as "objects" of tourism, but also as "subjects". In this perspective, the authors also examine the new partnership between the European Union (EU) and destination countries, as part of the so-called "Ecotourism Strategy". Since the Conference of Ministers of Tourism for the Mediterranean Region (CMTR) at Rome, in June 2009, the concept "ecotourism" has become a recognized new tourism target. Trailer Assist The Geddes DriveTrailer Assist (GDT) system is a commercially available electromechanical backup support system for trailing vehicle safety systems. The system was developed by Geddes Engineering and has been used in commercial drivers' education programs and as a model system for instructional video by the California Highway Patrol and other agencies. The system was first commercialized as the GDT 10 and is now known as GDT10+. The GDT 10 and GDT 10+ control a pair of hydraulic cylinders, which lift the trailer's rear end. The main system components are a computerized control unit and an alarm and emergency switch. The GDT has been marketed as a truck safety system, as a backup control system for a moving van. History The Geddes DriveTrailer Assist system was designed and developed in the 1970s by Neil Geddes, a mechanical engineer who studied the dynamics of two-wheel trailers and trailer brakes. By the early 1980s, a trailer backup control system became available. In the late 1980s, he began to develop an improved trailer braking and suspension control system and obtained government funding to build and test a prototype known as the GDT 10. The company he founded, Geddes Engineering was awarded a contract by the California Highway Patrol to build and market the system
