Simultaneous measurements of waveforms in two different channels of an ultrasonic interferometer are performed. A signal acquired by one channel is divided into two parts by a suitable amplifier. One is used to generate the reference signal in the other channel. A system error is defined as the difference in the amplitude of the reference signals. The system error is characterized by analyzing the measured waveforms. The system error on the waveform shape is small for well-functioning equipment. The system error on the amplitude is typically a few percent. The system error on the system parameter is almost negligible for the equipment used.
